

Data Dictionary

data/processed/lcr_disclosure_lines.csv

One row per (bank, quarter, disclosure line) - 230 rows: 2 banks x 5 quarters x 23 rows of the RBI's standard public LCR disclosure template.

Column	Type	Meaning
bank	str	HDFC Bank or IndusInd Bank
quarter	date (ISO)	Quarter-end date the figures are as of
row_id	str	The disclosure template's own row numbering (1-15, with 2i/2ii, 3i-3iii, 5i-5iii for lettered sub-items)
label	str	Short row description
unweighted	float	The raw balance, before any run-off/inflow factor is applied. NaN where the bank's own template doesn't disclose an unweighted figure for that row (see LIMITATIONS.md - this is consistently true for row 4, Secured wholesale funding, in both banks)
weighted	float	The value after the RBI's prescribed run-off or inflow factor - this is the figure that actually feeds the LCR calculation
source_file	str	Which PDF in data/raw/ this row came from
unit	str	million (HDFC) or crore (IndusInd) - the two banks disclose in different units ; see below
unweighted_inr_crore, weighted_inr_crore	float	The same two value columns, converted to a common Rs crore basis (1 crore = 10 million). Use these, not the raw unweighted/weighted columns, for any comparison of absolute rupee figures across the two banks

Units. HDFC Bank's disclosures state "Rs in million"; IndusInd Bank's state "Rs in Crores" - read directly off each PDF's own header, not assumed. Every ratio in this project (LCR%, funding-mix %, deposit-stability %) is computed within one bank's own figures, so the unit difference never touched a reconciliation or a comparison here. It only matters the moment someone reaches for an absolute rupee number across banks - which is exactly why the _inr_crore columns exist, rather than leaving that conversion to be done correctly (or not) by whoever opens the CSV next.

data/final/hqla_validation.csv

One row per bank-quarter. Confirms the disclosure's two copies of Total HQLA (row 1 at the top, row 13 restated just above the ratio) agree with each other, and recomputes LCR% from HQLA and the disclosed Net Cash Outflows as a cross-check against the bank's own printed ratio.

Column	Meaning
hqla_row1, hqla_row13	The two disclosed copies of Total HQLA
hqla_internally_consistent	True if they match
net_cash_outflows_row14	Disclosed Total Net Cash Outflows
lcr_disclosed_pct	The bank's own printed LCR%
lcr_recomputed_from_hqla_pct	$HQLA \div \text{Net Cash Outflows} \times 100$
lcr_gap_pct_points	Difference between the two

data/final/lcr_reconciliation.csv

One row per bank-quarter - the core reconstruction. Rebuilds Total Outflows, Total Inflows, the 75% inflow cap, and Net Cash Outflows independently from the row-level weighted figures (rows 2-7 for outflows, 9-11 for inflows), then compares each to the bank's own printed subtotal.

Column	Meaning
total_outflows_computed / _disclosed / outflows_gap	Sum of weighted rows 2-7, vs. the bank's own row 8, and the difference
total_inflows_computed / _disclosed / inflows_gap	Sum of weighted rows 9-11, vs. row 12
inflow_cap_75pct	75% of total_outflows_computed
inflow_cap_binding	Whether inflows exceeded the cap (True/False) - never true in this dataset; see LIMITATIONS.md
net_outflows_computed / _disclosed / net_outflows_gap	Outflows minus capped inflows, vs. row 14
lcr_computed_pct / lcr_disclosed_pct / lcr_gap_pct_points	HQLA ÷ net_outflows_computed x 100, vs. row 15, and the gap

data/final/funding_concentration.csv

One row per bank-quarter - funding mix and retail-deposit stability, all computed from **unweighted** (raw balance) figures.

Column	Meaning
retail_deposits, wholesale_unsecured_funding	Row 2 and row 3, unweighted
funding_base_ex_secured	Sum of the two above. Secured wholesale funding (row 4) is excluded - no bank in this dataset discloses its unweighted balance, in any quarter
retail_pct_of_funding_base, wholesale_pct_of_funding_base	Composition of that funding base
less_stable_pct_of_retail, stable_pct_of_retail	Row 2ii / 2i as a share of row 2
non_operational_pct_of_wholesale, operational_pct_of_wholesale, unsecured_debt_pct_of_wholesale	Row 3ii / 3i / 3iii as a share of row 3

data/final/comparative_summary.csv and comparative_verdict.json

One row per bank - trend and level summary across the 5 quarters (LCR level, min, max, 5-quarter trend; wholesale-funding share and its trend; less-stable-retail share and its trend; reconciliation pass rate). The JSON adds the written comparative finding built from those numbers.

Row IDs, in full

row_id	Label
1	Total High Quality Liquid Assets (HQLA)
2 / 2i / 2ii	Retail deposits - of which stable / less stable
3 / 3i / 3ii / 3iii	Unsecured wholesale funding - of which operational / non-operational deposits / unsecured debt
4	Secured wholesale funding
5 / 5i / 5ii / 5iii	Additional requirements - of which derivative/collateral outflows / loss of funding on debt products / credit & liquidity facilities
6	Other contractual funding obligations
7	Other contingent funding obligations
8	Total Cash Outflows
9	Secured lending
10	Inflows from fully performing exposures
11	Other cash inflows
12	Total Cash Inflows
13	Total HQLA (restated)
14	Total Net Cash Outflows
15	Liquidity Coverage Ratio (%)
